

Sharperlight

simplified intelligence

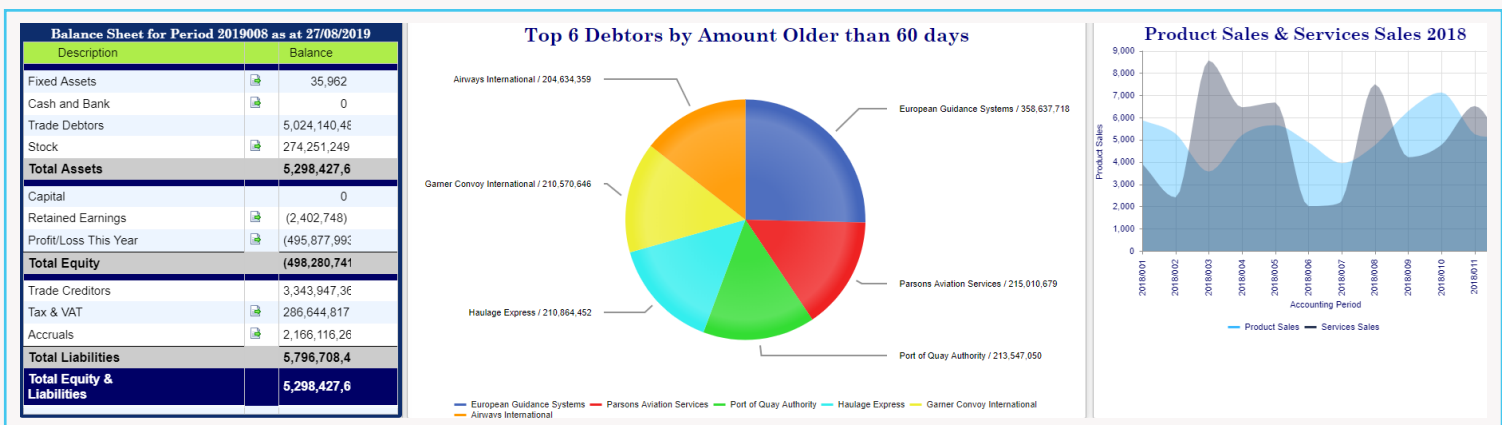

Your complex data simplified through a single, modular solution

Sharperlight delivers access to your application data across the organisation in a modular design, in real time, across singular or multiple enterprise applications, such as SunSystems, SAP, Microsoft Dynamics NAV, Opera and Maximo using a common interface.

Live, Dynamic & Refreshable Reports

Through Sharperlight, your data is securely shared between all your enterprise locations, updated and validated in real-time via the intuitive data entry and reporting interface.

- Excel Add-in with secure and direct access to data sources – refresh with current data
- Web channel displays tabular html and rendered charts for beautiful graphical presentation with drilldown
- Refresh chart data in real time
- Enterprise wide access to sources
- Rapid report creation, publication and delivery
- Low maintenance
- No embedded SQL encourages central Datamodel

in growth

Excel Reporting

The Sharperlight Excel Add-in gives end-users easy access to the Query Builder and a drilldown data explorer. The Sharperlight queries are anchored in the worksheets, using formulas and the construction of these formulas is wizard driven through the Query Builder. These formulas fully support cell referencing and automatic recalculation, so results will refresh as filters are changed or when a recalculation is forced.

- The Microsoft Excel Add-in is compatible with MS Excel 2007, 2010, 2013, 2016 and 2019.
- Cell, Table and Sheet formulas.
- Filter with cell referencing and automatic lookup windows appear when double clicking referenced cells.
- Query Manager for managing and re-using seed queries in the same workbook.
- The Sharperlight formulas are drilldown points which can loaded into Explorer for slice and dice analysis.

Web Reporting

Sharperlight can present dynamic tables, charts, pivot tables and presentation reports using its own web service. It has an application called Publisher, for managing and configuring these published queries. Each query can be filtered and refreshed in the web, and it will return the latest data. Every published query has a unique web address referencing the query and the output style. This means each query can be uniquely referenced in a webpage, or in an email, or bookmarked in a web browser. Publisher can also output reports to PDF, HTML and Microsoft Word.

Dashboarding

Dashboards are created and maintained using an HTML5 interface in a web browser. A dashboard consists of a page and each page can contain multiple rectangular tiles. The tiles can be resized and re-positioned, the tile can display published content from Publisher or display any valid web address. Every dashboard has a unique URL address and, thus, they can be embedded into any browser interface that supports a URL.
